

Extension of the AutoMock project approved

In the [AutoMock](#) project, a prolongation of the funding by the Federal Ministry of Education and Research has been approved. The results already developed for the extracorporeal (i.e. isolated) treatment of kidneys should be continued and finalised. This should, for example, enable a better transport of kidneys or also answer scientific questions outside of devoted animal experiments. In the upcoming part of the project, the user interface is to be enhanced and dynamic configuration during start-up as well as during operation is to be made possible. In order to achieve this, not only the communication bus used will be revised, but also a stronger integration of the entire interconnection hardware will be sought.
